PocketSmart AI Proposed Solution

PocketSmart AI is a web-based budget planning and recommendation assistant. It combines a simple planner interface with FastAPI and Gemini AI so that users can provide budget, preferences and context and receive structured suggestions for home interiors, parties and jewelry.

Core Modules

- User Authentication: registration, login and logout.
- Home Interior Budget Planner: room details, quantities and budget.
- Party Budget Planner: budget, guest count and event details.
- Jewelry Budget Planner: budget, occasion, style and optional outfit image.
- Recommendation Engine: Gemini AI interprets context and produces recommendations.
- History: users can review previous recommendation activity.

Key User Scenarios

Scenario 1: A user planning a room enters a budget and room requirements. The Home Planner sends the context to Gemini AI and displays suggested furniture, lighting and decor options.

Scenario 2: A user planning a party enters the event type, guest count and budget. The Party Planner returns suggestions for food, venue and decoration.

Scenario 3: A user wants jewelry for an occasion, enters budget and style, and optionally uploads an outfit image. The Jewelry Planner uses the supplied context to produce suitable recommendations.
