Project Name	PocketSmart AI
Team Members	Joison V, Gurun J, Sanjai Y, Aswarth U, Yaswanth N
Maximum Marks	5 Marks

Backend and Application Logic

The project documentation identifies FastAPI as the backend framework and Gemini AI as the recommendation layer. The implementation is organized around separate planner routes, authentication routes and a history route.

Route / Component	Purpose	Input / Output Context
/generate-home	Generate home interior recommendations	Room details, quantities, budget → recommendations
/generate-party	Generate party planning recommendations	Budget, guest count, event details → recommendations
/generate-jewelry	Generate jewelry recommendations	Budget, occasion, style, optional image → recommendations
/register	Create user account	Registration details → account/session
/login	Authenticate existing user	Login details → authenticated session
/logout	End session	Current session → logout
/history	Retrieve previous recommendation activity	Session/user context → history

Implementation Principles

- Keep AI/API credentials outside source code and configuration examples.
- Validate user inputs before passing context to the AI layer.
- Keep planner-specific logic separated so Home, Party and Jewelry flows can evolve independently.
- Return structured recommendation data that the frontend can display consistently.
- Maintain readable, reusable frontend templates and backend functions.
